### Upgrading PHP Version

Here are the instructions on upgrading your PHP to the latest version

NOTE: Not all modules are compatible with the latest version of PHP. All upgrades installed are done at your own risk. It is suggested that you do a full container backup before installing any updates..

1. Ensure you have yum installed. To check if you have yum installed, just type "yum" into your SSH session. If you do not have yum installed, please refer to this Installing Yum entry.

2. Add test repository update

```
cd /etc/yum.repos.d
```

```
touch CentOS-Test.repo
```

```
*****Append following lines to CentOS-Test.repo*****
```

```
[c5-testing]
```

```
name=CentOS-5 Testing
```

```
baseurl=http://dev.centos.org/centos/5/testing/$basearch/
```

```
enabled=1
```

```
gpgcheck=1
```

```
gpgkey=http://dev.centos.org/centos/RPM-GPG-KEY-CentOS-testing
```

```
*****End of CentOS-Test.repo*****
```

3. Run yum update

```
yum update
```
