

## **In2net Knowledgebase**

### **Function: Upgrade Applications**

The Upgrade Applications function will list all the applications installed on your VPS Container. Here you can add applications or remove applications installed in your server.

You can use the Upgrade Applications icon to upgrade the applications on your server. It will allow you to choose from applications that are included in your VPS Hosting Plan.

If you need an application that is not included in your Hosting Plan, you should upgrade your Hosting Plan or change it.

For example, no upgrades are currently available for the Budget VPS1010 Hosting Plan. When you click on the Upgrade Applications icon, you will see the error "No applications are available for the upgrade".
