

How do I add a domain to my hosting account (Transfer Registrar)?

This article is for clients who already has a domain registered with another registrar but wish to transfer the domain to In2Net for domain management.

*Note: This process only adds a domain to your hosting account, it does not automatically add the domain/website to your VPS Container.

To add transfer your domain:

1. Click on the Upgrade Center tab.
 2. Select Register New Domain.
 3. You will be taken to the In2Net Domain Selection order form. Select the Transfer existing radio.
 4. Enter the desired domain name and click on the Continue button. The system will then perform a query to determine if the domain name requested is available for transfer.
 5. If the requested domain name is available for transfer, it will be displayed under the Domains available for transfer section. Select the domain name you wish to transfer and continue by clicking on the Order Selected Domains button.
- Note: If a domain is not available for transfer, it could mean that the domain has not been registered yet. If this is the case, you can register the domain name with In2Net directly.
6. Click on the Order Now button to continue with your transfer registrar request.
 7. Select the preferred configuration settings and continue with purchase checkout and payment confirmation.
