

In2net Knowledgebase

What are the advantages of a VPS?

VPS gives you the features and functionality of a dedicated server without the cost of building and maintaining one. If you need to host unlimited domains, have complete control of your environment and run your own applications, then you will benefit from having a VPS. In addition, a VPS provides the ability to manage your dedicated environment directly through SSH or Remote Desktop Connection. In addition, you can use your control panel to perform actions to your VPS immediately without having to contact support to have a technician complete any necessary requests.
