

In2net Knowledgebase

I want to create a backup of my container and store it on the server.

To perform a Server Side backup:

In the case of server side backup, all the system data (including system files) are being saved. And the number of server-side backups allowed is subject to your Hosting Plan.

1. Click on the System tab.
2. Select Backup and Restore.
3. Click on the Server-Side Backup and Restore tab.
4. Select Create Backup.
5. Upon completion, you will see the "The Container backing up has been schedule successfully" confirmation.

All successful server-side backups will be displayed.

If you have already reached the backup limit of your hosting plan, you can simply delete existing backup file(s) before creating a new server-side backup.

To delete a server-side backup:

1. Check the box next to the backup file you wish to delete.
2. Click on the Delete icon.
3. Confirm the deletion request.
4. You will see the deletion confirmation on the screen.
