What is the Parallels Power Panel?

Parallels Power Panels (PPP) is a powerful and easy-to-use web-based tool to administer and recover personal containers.

With PPP, a user with administrative access to a container can easily perform many critical management tasks, while not requiring access rights to the server:

Start/Stop/Reboot Container - Control containers with Start, Stop, Fast Stop and Restart functions

Container Services Management - Manage container services and processes such as stopping an unresponsive task or restarting a service

Container Resource Monitoring - Monitor container resource utilization for CPU, system, disk space and disk inodes

Backup/Restore Container - Back up and restore containers including all system and user files

Container Repair - Start the container in repair mode when a container is broken and does not boot

Container Re-install - Reinstall the container from scratch, either saving or discarding existing files

Container Actions Log - View the container actions log to monitor resource shortage alerts and various container events

Embedded SSH or RDP Client - Connect via integrated SSH client (on Linux) or via Remote Desktop Protocol (RDP, on Windows) to the container
