

Changing server setting

In Server Backup Manager's web based console, you may use the "Servers" screen to work with Servers on which the Backup Agents are installed.

Click on "Servers" in the Main Menu to open the "Servers" screen.

In the Server list, select the server you would like to edit the properties by clicking on the icon as shown below.

The following screen will appear. Meaning of each property is provided below.

Server name - Enter a name for your server

Host name/IP - Enter the Host name or IP address of your server Port number - Define a port to connect to your server if different from the default port value (1167). You can configure the default server port using Windows Backup Manager Configuration Utility.

If you have changed Host name/IP and/or Port number, you should use [TEST AGENT CONNECTION] to make sure Backup manager can communicate with Backup agent on your server.

Press [SAVE] to save your new settings.
