In2net Knowledgebase

What is a disk safe?

- A Disk Safe is used to keep and arrange the pieces of replicated information. You can define a Disk Safe as a container for data needed for a restore.
  NOTE: You cannot start backing up a Device until there is a Disk Safe to which this Device can be backed up.
  To run a replication, you need to associate a Data Protection Policy with your Disk Safe. The Policy will back up the Disk Safe's associated Device(s).
  The Disk Safe Panel is divided into the following sections:
  Main menu Disk safe menu Disk safe list Detail pane
